Time-series forecasts are used in a wide range of economic activities, including setting monetary and fiscal policies, state and local budgeting, financial management, and financial engineering. Key elements of economic forecasting include selecting the forecasting model(s) appropriate for the problem at hand, assessing and communicating the uncertainty associated with a forecast, and guarding against model instability.

This document contains solutions to selected problems in Peter J. Brockwell and Richard A.

Davis, Introduction to Time Series and Forecasting, 2nd Edition, Springer New York, 2002. We provide solutions to most of the problems in the book that are not computer exercises. That is, you will not need a computer to solve these problems.

The notion is that the series can be decomposed into four elements: Trend (T_t) — long term movements in the mean; Seasonal effects (I_t) — cyclical fluctuations related to the calendar; Cycles (C_t) — other cyclical fluctuations (such as a business cycles); Residuals (E_t) —
